

MONTHLY
CYCLES REPORT

July 6-7, 2026
VOL. 44, NO. 7

PREVIEW by Pouyan Zolfagharnia

July is packed with geocosmic activity, suggesting that the month could prove highly significant for both geopolitics and the financial markets. The month began with Jupiter's ingress into the fire sign of Leo, where it will remain for the next year. This is an especially important transit because it has historically coincided with major turning points in the equity markets. As part of my research for *Forecast 2026*, I made the following observation:

"Across more than a century, the rhythm is unmistakable. Jupiter in Leo magnifies confidence, and confidence drives markets, art, and politics to their limits. Across the past ten transits, we have seen five instances of a 4-year cycle crest form in the equity markets and seven instances of a 4-year cycle trough, two of which were also 18-year cycle troughs (1932 and 2002). We are currently in the time band for the 18-year cycle trough, which means the upcoming Jupiter transit from June 30, 2026, until July 26, 2027, remains a key period in which history may repeat itself. Based on this study, there is a 50% chance that a 4-year cycle crest will form during this period. In the remaining five cases where the crest did not form with Jupiter in Leo, it formed with Jupiter in Aries–Gemini. Given that we know the current cycle is forming crests beyond the historical pattern, this increases the likelihood of a crest forming during this period. The sample also provides a 70% probability of a 4-year cycle (or greater) trough forming during the same period. Of the five cases where the crest formed with Jupiter in Leo, three of them (60%) also formed a trough in the same period."

Based on this research, I continue to expect the current 18-year cycle crest in the equity markets to develop while Jupiter transits Leo. There is also the distinct possibility that the subsequent trough may begin to emerge before Jupiter leaves the sign. After all, this signature has a much stronger correlation to trough formations. If both a crest and a trough are to unfold within the next twelve months, then the crest would most likely need to develop during the early stages of this transit.

July 2026 presents an unusually compelling geocosmic backdrop for such a scenario. We have several outer planetary signatures that are historically associated with major market crests. In geocosmics, rallies approaching an important high are often supported by harmonious aspects, particularly sextiles (60 degrees) and trines (120 degrees), even more so between the outer planets. At present, there is no shortage of these supportive configurations. The Uranus-Pluto trine, Jupiter-Neptune trine, Neptune-Pluto sextile, Uranus-Neptune sextile, and Jupiter-Uranus sextile are all active simultaneously.

Collectively, these signatures provide an ideal environment for powerful rallies to new all-time highs in the equity markets. They also symbolize a period in which optimism may be fueled by advances in technology, artificial intelligence, and space exploration, themes that all align closely with the symbolism of Jupiter, Uranus, Neptune, as well as Pluto in Aquarius.

What remains absent is the catalyst capable of bringing such optimism to an abrupt end. That trigger may arrive with the Jupiter-Pluto opposition on July 20. Jupiter acts as a lens, magnifying the underlying nature of the planet with which it forms an aspect. Pluto represents concentrated power, transformation, extremes, and explosive change. It is therefore noteworthy that this same planetary combination was active during the year 2000, when the dot-com bubble reached its climax before collapsing.

Although these slower-moving outer planetary aspects operate with generous orbs that can extend for several months, the concentration of supportive signatures, combined with the approaching Jupiter-Pluto opposition, creates one of the most compelling geocosmic environments we have seen for an important equity market crest early on in Jupiter's passage through Leo.

KEY POINTS AND OUTLOOK FOR TRADERS IN FINANCIAL MARKETS BY WYATT FELLOWS

The following are the key points in our longer-term view upon which we construct our intermediate-term investment strategies.

- **U.S. stock markets continue to make new all-time highs** into the “irrational exuberance” period centered in late July. Further new all-time highs are expected, but there is a new case of bearish intermarket divergence forming between the U.S. indices that may be sounding an alarm.
- **Gold has broken out to the downside in accordance with a 47-month low** due later this year. Gold could be getting close to such a bottom in terms of price but not quite in terms of time.
- **Silver is in a similar position to Gold** as evidence continues to mount that the January 2026 high was the 18-year cycle crest in this market. There will be significant rallies that transpire from time to time on the way to an 18-year bottom, and one of those rallies could be ready to launch from the June 26 low.
- **Copper has come off its all-time high of 6.72** but is now in the time band for a primary cycle low to form ideally this month. New highs are expected later this year.
- **T-Notes are struggling to gain upside momentum** but are still targeting 113-114 sometime this year.
- **The Euro has now turned bearish by falling below 1.1400.** This has greater implications beyond just the near term by signaling January 27 may have been a multi-year high for this currency.
- **Crude Oil continues to fall from the 119.48 high it made following the start of the U.S./Iran conflict.** However, it has now fallen back to fill the “gap up” in price left at the onset of the war, so a new trading range may now be set to commence.
- **Soybeans have fallen precipitously from the May highs** but now could be early in a new primary cycle. If the recent low was also an 11-month low, Soybeans could be ready to restart the upside momentum. We continue to look for an overall uptrend in grain prices into early 2027.

GEOCOSMIC CRITICAL REVERSAL DATES (CRDs): The following geocosmic critical reversal dates for all markets are based on the studies published in [The Ultimate Book on Stock Market Timing, Volume 3: Geocosmic Correlations to Trading Cycles](#). The more stars, the higher the correlation to a reversal. Three stars have the strongest correlation. Look for cycle crests or troughs to form within three trading days.

STOCKS DIVERGE AS PRIMARY CYCLE MATURES by Gianni Di Poce, MMA Analyst

[\[Back to Topic Menu\]](#)

Cycle	Progress
18-year	17 th year
9-year	6 th year
6-year	4 th year
46-month	44 th month
3-year	15 th month
50-week	14 th week
Primary (18 weeks)	14 th week

Stocks are flashing their most important reversal signal since the March lows right now. Over the past month, the Dow soared to a new all-time high, while the S&P has remained largely sideways. The Dow reached as high as 53,060 on Monday, July 6, while the S&P's all-time high from June 2 at 7693.75 in the September contract continues to hold. Given that the primary cycle has entered its later stages, this is a cautionary signal. However, with the Trickster (Mercury) now retrograde, a final blow-off rally that abruptly reverses cannot be ruled out, especially considering the direct motion (July 23) is part of the same cluster that includes the aspects related to irrational exuberance. More on this below.

Economically, things continue to move along. Kevin Warsh is the new Fed Chair, and it seems the market is looking for a rate hike around the end of the year. But we know with Venus retrograde this fall, monetary pivots are not outside the realm of possibility. Last week's lackluster jobs report supports the idea that the Fed could stay put on rates a bit longer than the market is currently pricing in. This could especially come into play as the market enters the orb for an intermediate-term cycle low starting at the end of November.

Hence last month's comments, which stated, *"...from a geocosmic standpoint, we're a little more than a month away from the most exciting time of the year. The series of trines between Jupiter and Neptune, Jupiter and Saturn, and Uranus and Pluto are all around the corner. This could continue to buoy markets near-term, but set us up for another round of real volatility starting sometime in the summer."* No change here, except that volatility could start soon after a larger top forms late summer or early fall.

LONG-TERM CYCLES

The long-term cycle situation in the Dow starts with the 18-year cycle that has a range of 15-21 years. 2026 is the 17th year of this cycle, and downside risks increase with each passing month. Stocks can become highly volatile in the late stages of these long-term cycles before finally topping out, all while still keeping their bull trend. The Dow made a new all-time high again this week, confirming the cycle is still bullish. Thus, the phases of the 18-year cycle must be used to narrow down the timing for the long-term high.

The ideal setup is for an 18-year cycle crest in stocks 1-2 years from now, but we can't rule out that a significant high isn't forming over the next several months. The 18-year cycle low would ideally occur around 2028, and no later than 2030. After an 18-year cycle high, a 35-67% bear market in the Dow is to be expected.

The 18-year cycle breaks down into either two 9-year phases, which have a range of 7-11 years, or three 6-year phases, which have a range of 5-8 years. Combination patterns unfold when both 9-year and 6-year cycles happen within the greater 18-year cycle.

The current 18-year cycle is either a two-phase or a combination pattern. The March 2020 trough was 11 years after March 2009, and was right on time for a 9-year cycle low. 2026 is the 6th year in the 9-year cycle, so downside risks are rising here too.

The 6-year cycle troughs must be looked at as well. The two previous 6-year cycle lows unfolded in August 2015 and October 2022, which makes 2026 the 4th year of the final 6-year cycle. A long-term cycle crest could unfold at any time, although a decent probability exists that this final 6-year cycle phase within the 18-year cycle goes parabolic, especially when considering the geocosmic factors in play. The 6-year and 9-year cycles both point to a long-term low around 2028, +/- 1 year.

INTERMEDIATE-TERM CYCLES

The following points are the most important factors in terms of intermediate-term cycles in the Dow Jones Industrial Average. The April 7, 2025 low was 30 months from the previous 3-year cycle trough of October 2022, and in the regular time band for a 3-year cycle low. The Dow experienced an 18.7% decline, satisfying the criteria for a 3-year cycle low. In most cases, pullbacks unfold in the 16-25% range.

There is still plenty of time in the 3-year cycle for a new all-time high, with the Dow still in the second 50-week cycle phase of this 3-year cycle. Regarding 3-year cycle phases, the April 7, 2025, low occurred 35 weeks from the August 5, 2024, low, and was in the 34-67 week range for a 50-week cycle low. The March 30, 2026, low was 51 weeks from the April 7, 2025, low, so it was right on time.

The other points are as follows:

- Perhaps the only real intermediate-term cycle risk right now is with a 46-month cycle scenario. It's not likely, but a potential 46-month cycle contracted and formed a low in October 2022, 31 months from March 2022. If a 46-month cycle is in play, then July would start the 46th month, and downside risks are rising into the back half of the year. This is not our bias, but carries a 10-20% probability. At the least, October 2022 was a low for multiple cycles: A 50-week, a 3-year, and potentially a contracted 46-month low. The first 50-week phase of this newer 3-year cycle was just completed on March 30, 2026, which means the second 50-week cycle phase within the greater 3-year cycle is underway.
- In President Trump's first term mid-term year in 2018, there were two double-digit corrections, with the first being the infamous Christmas Eve bottom. The Dow dropped for three months and almost 20% into the low before rallying nicely for the following fifteen months. We have an intermediate-term low whose orb comes due starting in late November.
- The volatility earlier in the year followed the previous "Gulf War" scenario, especially with respect to the Saturn-Neptune conjunction of 1989. Tensions kicked off several months after the third and final Saturn-Neptune conjunction of 1989, when Iraq invaded Kuwait in June 1990. 20-30% of the global oil supply was disrupted (similar to what unfolded this year), and oil prices more than doubled in a six-month

period. Stocks dropped nearly 20% in the same window (the Nasdaq dropped nearly 15% in 5 months this time). Interestingly, oil prices collapsed after this war, similar to what we've seen recently, while stocks soared.

- The Saturn-Neptune conjunction occurred on the Federal Reserve's Midheaven at zero Aries, and warns of a potential erosion of perceived independence and a crisis in authority. Kevin Warsh is the Fed Chair, but how long before his authority is contested, especially if he raises rates as the market expects later this year? Along with the crisis stemming from inflation, the solution may involve some sort of yield curve control or financial repression in time, perhaps by 2028 when Uranus is trine Pluto and Saturn is square Pluto. It all depends on inflation, which remains stubbornly high.
- Jupiter is now in Leo, which could add to the speculative fervor in the coming months. All of the outer planetary ingresses are complete for the year.
- Despite recent volatility in the technology sector, futuristic tech themes will likely remain an attractive opportunity in this market. This is mainly due to the central time band of Uranus trine Pluto beginning on July 18. It will be in effect until May 2028. Areas like quantum computing, AI, robotics, drones, networks, and other emerging innovations still look promising. Investors may also consider speculative opportunities in gaming, gambling, and entertainment, especially as Jupiter's transit through Leo begins in summer 2026. Markets could be setting up for an irrationally exuberant environment going into the trines between Uranus-Pluto, Jupiter-Neptune, and Jupiter-Saturn in July.

The Dow starts the 14th week in the second 50-week cycle as measured from the March 30 low at 45,057. The drop from the previous all-time high in February was seven weeks into the low, and in the 2-8 week range for a correction within a bullish 50-week cycle. July also starts the 15th month of the greater 3-year cycle.

Even though stocks are in the final phases of some longer-term cycles, it's early enough in the phases of shorter-term cycles for the market to keep making new highs in time. This has been a bullish first phase in the new 50-week cycle, although as will be explained below, the primary cycle is starting to flash real warning signs.

THE PRIMARY CYCLE

This week starts the 14th week in the primary cycle from the March 30 low at 45,057. The low occurred 19 weeks from the November 20 low at 45,728, in the regular 13-23 week range for a low, and one day outside the 3-day orb of the April 3-6 CRD. The low was 7 weeks from the all-time high of February 10 at 50,512, which happened in the 12th week of the previous primary cycle. The good news is that new highs this late in the primary cycle have virtually confirmed a case of “bullish right translation,” which occurs when a cycle spends more time going up than down. It’s a positive signal for the cycle to follow, too.

The primary cycle in the Dow breaks down into two or three cycle phases. Major cycles (three-phase) in the Dow last 5-8 weeks, while half-primary cycles (two-phase) last 8-11 weeks. The Dow is exhibiting another combination pattern in this primary cycle, too.

The Dow completed a major cycle low on June 23 at 51,301, five weeks from the previous major cycle low on May 20. On June 10, in the 10th week, it completed a 7-11 week half-primary cycle trough. Thus, the DJIA now starts the 4th week of its second half-primary cycle, and the 2nd week in the third and final major cycle phase. Cyclical overlap for a low between all cycles begins in 3-7 weeks.

This week also starts the 14th week in the primary cycle in the S&P futures, as measured from the March 31 low at 6353.25. The low was 19 weeks from the November 21 low at 6525, in the regular 15-23 week time band for a low, and in the orb of the April 3-6 CRD. However, the S&P still hasn’t made a new cycle high past Tuesday of the 9th week, which leaves the door open for a final rally higher before the primary cycle tops out.

The primary cycle in the S&P consists of phases that include major cycles lasting 5-8 weeks and half-primary cycles lasting 8-12 weeks. A major cycle trough occurred on June 26 at 7357.25 after a 4-day corrective decline

into the low from the June 22 crest. This week begins the 2nd week in the third and final major cycle phase. But there's a combination pattern unfolding here too, with this week starting the 4th week in the second half-primary cycle from the June 11 low.

GEOCOSMICS

In terms of geocosmics, we're currently in the middle of the July 6 CRD. This one features Mars trine Pluto (July 5), Sun square Saturn (July 6), and Neptune retrograde (July 7). Venus also ingresses into Virgo on July 9. We can't rule out a primary cycle crest forming here, although it would be preferable to unfold in the next CRD on July 17-20, given the quality of the signatures.

As explained last month and still the case, *"The July 17-20 CRD may be the most exciting of 2026. It starts with Venus square Uranus on July 13, followed by Uranus sextile Neptune (July 15), Uranus trine Pluto (July 18), Jupiter trine Neptune and opposite Pluto (July 20). Mercury then goes direct on July 23. The bias right now is for a primary cycle crest in the July 17-20 CRD +/- 3 trading days, but it may last up to a week in this case."* No change. With stocks hitting new all-time highs as Mercury approaches its midpoint, a sharp reversal could ensue in this CRD if a pullback doesn't happen now. In theory, if it tops out this week, it could form a primary cycle low as soon as the July 17-20 CRD, as that would be in the 2-5 week corrective period for a low during a bullish primary cycle.

There's another CRD on August 7-10. This includes Venus ingressing into Libra (August 6) on the same day as Sun trine Saturn. Venus is then trine Pluto and opposite Neptune on August 10, followed by Mars ingressing into Cancer on August 11, on the same day as Venus trine Uranus. In theory, this CRD could correspond to a primary cycle trough too.

When it comes to technicals, the Basic Trend Indicator remains fully bullish in the Dow with last week's new all-time high. The S&P may have formed a lower-high during the June 22 crest, but may have formed a higher-low during the June 26 trough. The bias is still bullish with respect to the S&P trend, although it may also be considered mixed. A new all-time high would confirm it for the bulls in the S&P.

For moving averages, the trend in the Dow remains bullish. Prices remain above the 15-day moving average and the 45-day moving average. The 15-day moving average is above the 45-day moving average, and with prices above both, it's bullish. It would be downgraded back to bearish if prices closed below both the 15-day average and the 45-day moving average, and the 15-day drops below the 45-day moving average. It will be downgraded to bullish, turning neutral if prices drop below the 15-day moving average, but it stays above the 45-day moving average. Note how prices dropped below the 15-day moving average on June 11, and almost even tested the 45-day moving average for a half-primary cycle trough. On the weekly moving averages, prices are above the 25-week, the 50-week, and the 78-week moving averages. The 25-week moving average is above the 50-week and 78-week lines, so it's bullish.

On the momentum front, the first cracks in this rally are starting to emerge. The RSI indicator hasn't hit new highs with prices in both the Dow and the S&P. At this stage of the primary cycle, this signals caution at the very least. Not to mention, the S&P hasn't hit a new all-time high since early June; thus, we have an intermarket bearish divergence signal going on for a month now. Even so, note how the recent major cycle lows occurred with the RSI in the 40-60 range.

Regarding price patterns, the Dow has formed an ascending price channel on its daily chart. These are continuation patterns, and as long as prices are within the channel, it's bullish. If prices break below the lower trendline of the channel, it would only mean that the market's rate-of-ascent, or slope, is no longer valid. It would

not signal an end of the uptrend. If it breaks out above the upper trendline of the pattern, which it looks to be attempting now, it could rally into a blow-off top in the 59,500-60,500 zone for this primary cycle. With the trickster in play now (Mercury Rx), a respectable amount of caution must be taken regarding breakouts. The preferred upside objective for a final rally in this primary cycle is in the 55,000-56,000 zone. There is a larger target at 59,600-60,500 for late summer or early fall. As long as the Dow holds above 48,500-49,000, the path of least resistance remains higher. Last month stated, *"The triangle pattern continues to project a rally as high as 52,000-52,250. Note how this overlaps with the previous upside objectives in the 53,450 +/- 1990 zone."*

For the S&P, prices are now consolidating within an ascending triangle pattern. The upside resolution from the broadening wedge continued in the past month. These are also continuation patterns, which means they often resolve in the direction of the underlying trend. But remember, Mercury is retrograde and the primary cycle is late. Continuation patterns that occur late in cycles must be met with a healthy dose of caution. For now, we'll still look for a close above 7623 to coincide with a breakout as high as 7950-8050. Plus, the S&P still hasn't hit the previous target at 7650-7700, projected from the previous wedge. As stated before and still the case, *"The S&P is solidly bullish technically as long as it holds above 7250-7300 on any pullbacks, which was the former resistance near the previous all-time high. This may even be tested this week. If the S&P lost 7250-7300, the next stop would be 7050-7150."*

TRADING STRATEGIES

Position traders for the Dow: They are long with a stop-loss on a close below 51,202 now. Traders were advised, *"Cover 1/3 on a rally to 52,300 +/- 60 if offered."* Got this off for an excellent first profit. Let's cover another 1/3 on a rally to 55,000 +/- 60 if offered.

Aggressive short-term traders for the Dow: They are long with a stop-loss on a close below 51,202 now. Traders were advised, *"Cover 1/3 on a rally to 52,200 +/- 60 if offered."* Let's cover another 1/3 at 53,650 +/- 60 and the final 1/3 on a rally to 55,000 +/- 60 if offered and stand aside.

Position traders for the S&P: They were flat and advised, *"... go long on a drop to 7350 +/- 12 with a stop-loss on a close below 7131 if offered."* Got it. Let's cover 1/3 on a rally to 7600 +/- 12 if offered and another 1/3 on a rally to 7850 +/- 12 if offered.

Aggressive short-term traders for the S&P: They are long with a stop-loss on a close below 7278 now after capturing 1/3 already for an excellent gain. Cover another 1/3 on a rally to 7700 +/- 12 if offered.

Short-Term Reversal Dates in U.S. Stocks: Look for isolated highs or lows in these solar-lunar periods, +/- 1 day, especially in the DJIA, from which prices reverse at least 2.5% (and better if 4%). These are potential reversals according to more recent studies of the DJIA since June 26, 1930, conducted by MMTA student Yating Hu.

GOLD: HAS THE 47-MONTH CYCLE LOW FORMED? by MMA Analyst Wyatt Fellows

[\[Back to Topic Menu\]](#)

Cycle	Progress
7.83-year	44 th month
47-month	44 th month
50-week (2 nd phase)	36 th week
18-week primary	1 st or 15 th week

Gold fell to a new multi-month low on June 30. This is certainly a candidate for a long-term low; however, the more ideal time band occurs between August and December of this year. The bottom line is that no matter when the low actually forms, we are closer to a bottom than a top and need to be ready to buy this market. Long-term holders of Gold could even consider buying any time Gold dips below \$4000.

LONG AND INTERMEDIATE-TERM CYCLES

Gold most likely has a longer-term 16-year cycle that typically breaks down into two 7.83-year phases. The current 7.83-year cycle bottomed on November 3, 2022, when Gold reached a low of 1618.30. July will be the 44th month of this current 7.83-year cycle. Our bias continues to be that new highs (or at least a re-test of the all-time high) are in store heading into 2027 before this 7.83-year cycle ultimately tops out. However, with Saturn forming long-term aspects with Uranus, Neptune, and Pluto in January, February, and March of this year, a legitimate argument could be made that the blow-off top that occurred on January 29 was indeed the 7.83-year crest. This possibility is also supported by historical precedent. Four out of the last six 7.8-year crests have peaked between 34 and 41 months following the start of the cycle. For context, January 2026 was the 37th month.

This 7.83-year cycle is breaking down as a two-phased pattern of 47-month cycles instead of the usual three-phased pattern of three 31.5-month cycles. The crest of this first 47-month cycle formed on January 29, and the bottom is due anytime between now and June of 2027. However, our bias is that it will form sometime in 2026. There is a small chance it may have even occurred on June 30, but this is far from certain.

These 47-month cycles then break down into two 23-month cycle phases that in turn break down into two 50-week cycle phases each. Gold is currently in the 20th month of the second 23-month cycle measured from the low of November 2024, and the week of July 6 starts the 36th week of the final 50-week cycle measured off the October 2025 bottom. All of these cycles are converging for a major low ideally in the August-December timeframe as shown on the weekly chart.

Last month, we then went on to state, *“However, with so many cycles coming due, we need to seriously consider the possibility of a contraction occurring with a bottom forming as early as July. It would be ideal if Gold were to test the 67-week moving average before bottoming.”* The June 30 low was one day before the calendar changed to July, so that could have been it. Price also thoroughly tested the 67-week moving average and has held. The low price of 3955.40 was also into the more refined price range that was given in the MMA Mid-Year Webinar for a 47-month bottom, which was 3800.00 +/- 200.00.

While there is compelling evidence that a 47-month cycle low could be in, my bias at this time is that the June 30 low will either be re-tested or taken out in the next 3-4 months before a more lasting bottom forms.

THE PRIMARY CYCLE

Preferred Labeling: Primary cycles in Gold last 15-21 weeks and break down into phases of three 5-7 week major cycles or two 8-11 week half-primary cycles. July 6 will begin the 15th week of the primary cycle, measured from the March 23 low of 4162.60 in the August contract (this labeling is shown on the Aug daily chart). The cycle has now turned bearish by taking out the March 23 low, but has now entered the time band for a bottom to occur anytime in the next 7 weeks.

My bias for this labeling continues to be that June 17 was a major cycle crest, and Gold is now in the 4th week of the final major cycle due to bottom in 2-4 weeks. However, as this is the final phase of the primary cycle, it may contract by a week. For this bias to continue to be valid, Gold would need to find a corrective top soon, perhaps in this July 6 CRD, and then fall below last week's 3955.40 low. Indeed, Gold is finding resistance at the 15-day moving average on July 6 at the time of this writing.

If Gold breaks below 3955.60, the downside price target for a primary cycle low remains at 3865.00 +/- 124.00. Note how this price overlaps the refined price target for a 47-month cycle low given above.

Alternate primary cycle labeling: July 6 could begin the 1st week of a new primary cycle, measured off the June 30 low. This low has some compelling reasons for being a primary cycle bottom. First, it could have been either a contracted primary cycle in the 14th week of the preferred labeling, or a normal-length primary cycle that bottomed in the 21st week if measured from the February 2 low (shown on the daily nearby futures chart). Second, it occurred in the June 26-29 CRD period. And finally, last week's low was into a downside price target, and the low formed with bullish oscillator divergence as well as bullish intermarket divergence with Silver.

This labeling could become the preferred if Gold can start having consecutive daily closes above the 15-day moving average, and certainly if Gold trades above the June 17 high of 4403.60. In fact, the minimum upside price target for a new primary cycle crest would be 4436.50 +/- 114.00.

GEOCOSMICS

Last month, I stated, *“However, the focus will be on the end of the month with the June 26-29 CRD. Mercury will be stationing retrograde at that time, followed by a strong reversal signature in Mars conjunct Uranus on July 4. Should Gold be falling into this time frame, a primary cycle low could be forming.”* Bingo, now Gold just needs to confirm. The only pause and hence the two possible primary cycle labelings is the fact that Mercury had turned retrograde on June 29. Signals that occur when the trickster is retrograde are often not reliable.

The next CRD occurs July 17-20 but carries a 10-day orb due to multiple longer aspects taking place, such as Uranus trine Pluto, Jupiter trine Neptune, and Jupiter opposite Pluto. For Gold, the narrowed-down CRD of July 24-27 +/- 3 trading days could be the next important reversal period. During this time, Mercury will be stationing back direct on July 23 while Saturn goes retrograde on July 26. The Sun will then activate those long-term aspects just mentioned by opposing Pluto and trine Neptune on July 26 before forming a sextile with Uranus on July 27. These aspects all take place shortly after the Sun enters its home sign of Leo on July 22.

Depending on which path Gold takes over the next few weeks, the July 24-27 CRD could be a bearish primary cycle crest forming or a re-test or lower low forming. If rising, we should be taking some profits off the table. If falling, we should be looking to establish long positions.

TRADING STRATEGIES

Position traders are flat. We do not usually give position trading recommendations when Mercury is retrograde. However, if Gold is falling into the end of July, traders may wish to probe the long side at 3825.00 +/- 25.00.

Aggressive traders were flat and last month advised, *"Go long at 4160.00 +/- 20.00. If filled, set the initial stop-loss on a weekly close below 4000.00."* We are long. Exit 1/3 at 4275.00 +/- 15.00 and 1/3 at 4400.00 +/- 20.00. Use the same stop-loss. If stopped out, try the long side again at 3850.00 +/- 25.00 with a stop-loss below 3600.00 to start.

Very Aggressive Traders (VAT) were short but were technically stopped out with the close below 4100.00. Go long again at 3950.00 +/- 20.00 or 3850.00 +/- 25.00 depending on your risk tolerance. If filled, set the stop-loss below 3600.00 for now. Conversely, traders can go short at 4400 +/- 20.00 with a stop-loss on a close above 4570.00. You may take both of these trades if they occur.

Short-Term Reversal Dates in Gold: Look for isolated highs or lows in Gold within one trading day of these solar-lunar periods, from which prices reverse at least 2.5% (and better if 3% or more):

July 9-10 ** (bias for lows)

July 13-16 * (bias for crests)

July 23 *

July 29-31 **

HAS SILVER FORMED ITS PRIMARY TROUGH? By Pouyan Zolfagharnia, MMA Analyst

Cycle	Progress
18.5-year	18 th year
9.25-year	6 th year
4.3-year (52 months)	33 rd month
26-month	4 th or 9 th Month
Primary (17 weeks)	2 nd or 15 th week

Silver remains within the bearish price channel, and as explained in prior months, we were expecting a seasonal low with the Sun's transit of Cancer. The important question is whether or not the primary cycle trough has formed with the June 26 low of 5570. If it has formed, how high can it rally and for how long?

LONG AND INTERMEDIATE TERM CYCLES

The current 18.5-year-long-term cycle in Silver commenced in October 2008. This cycle usually breaks down into two 9.25-year half-cycles, which form the 4.3-year or 52-month cycle. The trough of March 2020 was either an extended 9.25-year cyclical trough or the second of three 6-year troughs off the low of October 2008. Based on the previous 18.5-year cycles, we tend to get a longer 9.25-year cycle (of around 11 years) followed by a shorter one (of around 7 years). We are now in the second, shorter, 9.25-year cycle, which commenced in March 2020. As such, I think the first 4.3-year half-cycle phase also formed early in October of 2023. Therefore, we are in the mature phase of the longer cycles. We are in the final 4.3-year cycle, which will end the greater 9.25-year and 18.5-year cycles. Therefore, even if the primary cycle trough formed on June 26, I am not expecting prices to break out of the longer-term bearish trend. My bias is for a corrective rally into July-August, before the next move down.

The 26-month half cycle to the final 4.3-year cycle either formed on October 28 or March 23. Therefore, we are in the final 26-month cycle, which should end all the long-term cycles. If this cycle commenced on October 28, we are currently in the 9th month of the final 26-month cycle that topped out in the 3rd month, but has not turned bearish yet by taking out the low that commenced the cycle. My bias is that the 26-month cycle formed on March 23, in which case we are in the 4th month of the cycle, which has now turned bearish. In either case, I would anticipate the final 26-month cycle to turn bearish by taking out the low that commenced the cycle, and end by forming the 4.3-year, 9.25-year, and 18.5-year trough.

My bias is that the 18.5-year crest formed on January 29 at 12179. If this is the case, and we do not take this high out in the next 5 months, the Fibonacci price targets for the 18.5-year trough are 6510 +/- 1337. However, it is worth noting that Silver declined 70-90% from its prior blow-off tops of 1980 and 2011. This could take Silver below 3000. It is also worth noting that Silver has a high correlation to forming a trough as the lunar North Node transits Aquarius (August 18, 2026, to March 7, 2028). This is the basis for my bearish bias.

The intermediate outlook remains bearish for the basic trend indicator in the weekly chart as we continue to form lower-lows and lower-highs. The trend will be upgraded to neutral if we take out the high of May 13 at 9011.

The intermediate moving average trend indicator remains bullish, turning neutral, as prices remain below the fast 19-week moving average (MA), which is above the slower 56-week MA. Prices dipped below the slow 56-week MA, which briefly turned the trend neutral.

THE PRIMARY CYCLE

The typical primary cycle in Silver is 17 weeks, with a range of 13-21 weeks. My preferred outlook is that we are commencing week 2 of a new primary cycle, which bottomed on June 26 at 5570. The low formed on the June 26-29 CRD and was accompanied by bullish oscillator divergence in the CCI.

The major cycle phases tend to form between weeks 4-7 in a three-phase cycle and weeks 7-11 in a two-phase cycle. So, it is still too early to label this new cycle. However, it is still possible that we are commencing week 15 of the older bearish three-phase cycle, which began on March 23. Under this scenario, we are commencing week 4 of the third and final major cycle, which is due to bottom with the primary cycle sometime over the next four weeks.

Under the preferred outlook, we should see Silver rally up to 7290 +/- 406 at least. We may see prices finding

resistance at the 43-day Moving Average (MA), currently around 7200, and falling. If prices are testing the 43-day MA in the price zone given, look to cover your profits. We may even see prices re-test the upward sloping trendline, which is likely to act as resistance.

GEOCOSMICS

As noted in prior months, *“From a geocosmic perspective, the seasonal trend for Silver is to form a crest with the Sun in late Taurus (May 14 +/- 5 days) before turning bearish, with a trough formation as the Sun moves into Cancer (June 21 +/- 5 days).”* So far, the low appears to have formed on June 26, and this is the reason behind my bias that the primary trough may have formed.

Now I’m looking for a crest formation with the Moon’s transit of Aries around July 7 +/- 3 trading days (this is in orb of the July 6 CRD) or August 3 +/- 3 trading days (this is in orb of the August 7-10 CRD). Therefore, we have to cover the long positions early, as the primary cycle is at risk of turning bearish with left translation (the crest of the cycle forming in the first half of the cycle).

TRADING STRATEGIES

Position traders: We advised to *“Go long on a decline to 5500 +/- 50 with a stop-loss below 5300 for now.”* We missed the entry by 20 basis points! Look to go long on a decline to 5700 +/- 50 in case of a double-bottom formation or if the alternative outlook is active, with the stop-loss below 5300. If not, go short on a rally to 6934 +/- 50 with a stop-loss above 7350.

Aggressive traders: We advised to *“Go long on a decline to 6108 +/- 50 with a stop-loss below 5900 for now.”* We got it! Cover 2/3 on a rally to 6880 +/- 50, and the remainder at 6900 +/- 50 if offered. Go short at 6934 +/- 50 with a stop-loss above 7250.

Short-Term Reversal Dates in Silver: Look for isolated highs or lows in Silver within one trading day of these solar-lunar periods, from which prices reverse at least 2.5% (and better if 4%):

July 4-6** (Bias towards troughs)
July 8-10* (Bias towards troughs)
July 14-17***
July 17-19* (Bias towards crests)

COPPER

IS THE CREST IN FOR COPPER? By Pouyan Zolfagharnia, MMA Analyst

[\[Back to Topic Menu\]](#)

Cycle	Progress
8-year	3 rd year
4-year (47 months)	33 rd month
24-month	11 th month
<i>16-month</i>	<i>15th month (if active)</i>
Primary (20 weeks)	15 th week

As noted last month, “Whilst there is still time for Copper to rally, my bias is now shifting towards the outlook that the crest may have formed. Over the coming month, I would like to see a correction in Copper as the seasonal trough is due in line with Silver.” The double-top in Copper held, and we appear to have formed the second major cycle trough on June 24 at 5.924. Can we see another rally, or has the primary cycle crest formed?

TREND INDICATORS

The **Basic Long-Term Trend Indicator** remains bullish as we are still forming higher-highs and higher-lows. The trend will be downgraded to neutral if we fail to take out the May 13 high of 6.716 or if we take out the March 23 low of 5.246.

Moving Averages Trend Indicator remains bullish, as prices remain above the faster 35-week MA. The faster 35-week moving average remains above the slower 52-week. If prices close below the 35-week MA, the trend will be downgraded to bullish, turning neutral.

LONG AND INTERMEDIATE TERM CYCLES

The 8-year cycle in Copper tends to break down into two 4-year half-cycle phases, which in turn break down into the 24-month intermediate cycle phases. The current 8-year cycle commenced on October 23, 2023, at 3.520 ('4' on the weekly chart). The 4-year cycle tends to break down into 24-month half-cycle phases. However, the low of April 2025 tested the trendline, which opens up the notion that the 4-year cycle may be breaking down into a three-phased pattern of 16-month sub-cycles. We may also be in a combination cycle, with troughs forming at the 16-month and 24-month intervals. What is interesting to note is that the next 12-month half-cycle to the 24-month cycle is due at the same time as the 16-month cycle. Therefore, we could see prices testing the moving averages or the trendline around August 2026 +/- 3 months. This may overlap with the end of the current primary cycle, which is also due August +/- 1 month (refer to the hot zone in the daily chart).

As noted in prior months, *"If we are in the new 4- and 8-year cycle, we could see Copper rally to a new ATH as the MCP price target for the 4-year cycle is 6.587 +/- 0.545."* We reached this target with a new ATH of 6.716, set on May 13. Looking at the monthly chart, you will see that this price target aligns with two key technical trendlines. The blue trendline connecting all prior ATHs of 1989, 2006, 2008, and 2011 is within the price target. The more moderate pink trendline connecting the 2006 ATH to the 2011 ATH has also been satisfied. I am not expecting these trendlines to be taken out.

THE PRIMARY CYCLE

The typical primary cycle in Copper lasts 21 weeks, with a range of 17-25 weeks. We are commencing week 15 of the bullish three-phased primary cycle that formed on the March 23 CRD at 5.246.

The major cycle phases tend to form between weeks 6-8 in a three-phase cycle and weeks 9-13 in a two-phase cycle. The first major cycle trough formed in week 6 on May 4 at 5.820. The second major cycle trough, or the half-primary, formed on June 24 at 5.924. Therefore, we are either commencing the second week of the third and final major cycle or the second half-primary cycle. My bias is that we are in the third and final major cycle that is next due to bottom in 5-7 weeks. This points to a low forming sometime in August. As noted above, this may also be the 12-month and 16-month intermediate cycle troughs too.

If the primary cycle crest has formed at 6.716 on May 13, the price target for the primary cycle trough is 5.981 +/- 0.174. However, since this may also be the 16-month trough, the price target for that is 5.373 +/- 0.317. This second target corresponds to the MCP target of 5.379 +/- 0.158. Hitting this price target would bring Copper back near the start of the primary cycle. Oftentimes when longer cycles are due, price will drop back to the previous phase low. I'm looking for us to take out the low of 5.924 with bullish divergence in the CCI. If we reach any of these price targets whilst the prior two conditions are met, we should be looking to go long.

TRADING STRATEGIES

Position traders: They are now flat. Look to go long on a decline to 5.808 +/- 0.1 with a stop-loss below 5.600 for now. If stopped out, probe the long side again at 5.379 +/- 0.1 with a stop-loss below 5.240.

Aggressive short-term traders: They are short 2/3 with a stop-loss above 6.600 for now. We managed to cover 1/3 at 5.981 +/- 0.1 for a great profit. Cover another 1/3 at 5.924 +/- 0.1 and the remainder at 5.808 +/- 0.1. Then pivot long at 5.709 +/- 0.1 with a stop-loss below 5.600 for now. If stopped out, probe the long again at 5.379 +/- 0.1 with a stop-loss below 5.240.

TREASURIES – T-NOTES

T-NOTES STRUGGLING TO GAIN UPSIDE MOMENTUM by Wyatt Fellows, MMA Analyst

Cycle	Progress
18-year	8 th year
5-year (60 months)	3 rd year
30-month	2 nd month
15-month (65 weeks)	2 nd month
Primary (18 weeks)	7 th week

Over the last 4 weeks, T-notes have traded in a relatively narrow but upward-sloping range. On the positive side is the fact that since bottoming on May 19, this market is technically making higher highs and higher lows (declining yields). This has led to a flattening of the yield curve thanks to new Fed chair Kevin Warsh coming across as a little more hawkish than most analysts thought following the June FOMC meeting. With Crude Oil back under \$70, one would think future inflation data and expectations might surprise in a positive way for bond market bulls.

LONG AND INTERMEDIATE CYCLES

The longest cycle we observe in T-Notes is 18 years long with a range of 15-21 years. The cycle last bottomed in October 2018, and following a sharp rally into March 2020, T-Notes have fallen below that October 2018 low, rendering this 18-year cycle bearish. The long-term implications of this are that we are now in an environment of rising interest rates for the foreseeable future.

The other thing that has transpired since the 2018 low and Covid high is that T-notes seem to be breaking down into 5-year (60-month) subcycles on a very consistent basis. This is somewhat shorter than the normal 5-7-year cycles we had been used to seeing in this market. These 60-month cycles have been further divided into two 30-month cycles, which have then been dividing into two 15-month cycles. The last 60-month cycle bottomed in October 2023, exactly 60 months from the October 2018 low. May 2026 was 31 months from October 2023, so the low that occurred on May 19 is a very good candidate for a 30-month cycle bottom if we allow a 2-month orb.

T-notes have yet to get much going on the upside to fully confirm this, but our bias is that this confirmation will eventually manifest itself.

The 30-month cycle is divided into two 15-month cycle phases. Measuring from October 2023, the first 15-month cycle bottomed in January 2025, lasting exactly 15 months. May was the 16th month of the second 15-month cycle, and with a range of 14-16 months, the May 19 low fits here too. Price also came down and tested the bottom trendline of a massive wedge chart pattern and held (see weekly chart).

As noted above, T-notes have yet to establish definitive upside momentum, but if they can, July would be starting just the 2nd month in both the 15- and 30-month cycles. This should lead to bullish price action during the summer months with an initial upside target between 113/00-114/00. This would align with the top trendline of the wedge pattern visible on the weekly chart. A breakout above this trendline and 119/00 +/- 1/10 becomes an achievable objective. This price range includes the 38.2% retracement of the move down from the March 2020 high to the October 2023 low.

THE PRIMARY CYCLE

Primary cycles in T-Notes typically last 15-21 weeks and break down into two phases of 8-11 week half-primary cycles and/or three phases of 5-7 week major cycles. However, based on the fact that the 15-month cycles have been breaking down into half-cycles of 32.5 weeks, a more normal primary cycle in T-notes might now be 16.5 weeks +/- 3.5 weeks, or in other words, 13-20 weeks in length.

July 6 begins the 7th week of a new primary cycle, measured from the May 19 low of 108/18 in the nearby contract. The low would have occurred 17 weeks from the previous bottom, so right on time. While our bias is that a new primary cycle is underway, the rally so far has been underwhelming to say the least. Only within the last few weeks have T-notes finally traded back above the 45-day moving average and exceeded strong resistance at 110/00-110/08 (bearish crossover zone). However, they are currently back below this level again now. If they can again trade back above it, the initial upside target is still 111/15 +/- 22.

Prior to this week, we had thought the first major cycle crest occurred June 15, followed by a major cycle low

on June 22, forming in the 5th week. However, I think a better fit now might be that the first major cycle crest formed on June 26 at 110/105 and is now immersed in a corrective 3-8 day decline into a major cycle low due by the end of this week. It's even possible the low came in on July 2, following a four-day decline. A decline lasting longer than this week would signal that our original assumption for the major cycle labeling was correct, or that this primary cycle is destined for a two-phased or combination pattern.

The bottom line is that we expect an upward bias to persist into the end of July or August at least if indeed 15- and 30-month lows formed in May.

GEOCOSMICS

Last month stated, *"The next official CRD isn't until June 26-29, which includes Mercury stationing retrograde. If T-notes haven't turned by then, I would expect a low to happen at this time."* Instead of a low, T-notes look to have formed a major cycle crest in this CRD and are now declining into an anticipated major cycle low. July is a very active month geocosmically with the first CRD occurring on July 6 +/- 3 trading days. T-notes are falling into this CRD, so I like the odds for a major cycle low forming early this week if it didn't already occur on July 2.

The big CRD for the month (and perhaps the year) takes place July 17-20 and includes long-term aspects like Uranus trine Pluto, Jupiter trine Neptune, and Jupiter opposite Pluto. This last aspect could be important for this market as Pluto rules over debt. However, I think the more important period geocosmically for this market is July 24-27 +/- 3 trading days. This is when Mercury will be stationing direct on July 24 while Saturn turns retrograde on July 26. Then on July 27, the Sun will oppose Pluto. I like this time for a primary cycle crest to occur if T-notes are making new highs.

TRADING STRATEGIES:

Position traders: are long. Exit 1/3 at 111/15 +/- 05. Move the stop-loss up to a weekly close below 108/15.

Aggressive traders: are long. Exit 1/3 at 110/25 +/- 05 and 1/3 at 111/21 +/- 05. Move the stop-loss up to a weekly close below 108/15.

[\[Back to Topic Menu\]](#)

CURRENCIES – THE EURO

THE LONG-TERM CYCLE CREST APPEARS VERY MUCH BEHIND US, by Ulric Aspegren, MMA Analyst

[\[Back to Topic Menu\]](#)

Cycle	Progress
16-year, 8-year, 4-year	3.7 years
24-month (intermediate)	17 th month
33-week (primary)	17 th week
12-week or 16-week	2 nd week (or 17 th)

EURO Preferred Weekly Chart, as of July 3, 2026.

The preferred view is that July 6 starts the 17th week of the 33-week primary cycle, off the March 13, 2026, low at 1.1410 USD. Since the June 8 report, the prices made a bottom in week fifteen on June 24, at 1.1324. This low occurred around the June 26-29 Critical Reversal Date and could have been the first sub-cycle low within the primary cycle. Since then, prices have come up 1.31%, reaching so far 1.1472 on July 2, and closing last week at 1.1435.

THE LONGER-TERM CYCLES

I am assuming we are 3.7 years into its 16-year, 8.4-year, and 4-year cycles, all of which started on September 28, 2022, at 0.9534. The prices have been projected to keep heading north towards a 4-year cycle crest, which has been expected to unfold sometime between August 2025 and December 2026. The favored outlook is that the 4-year cycle peaked out on January 27, at 1.2078, with the presence of the conjunction of the long-term Saturn-

Neptune planetary pair. If this is correct, then the prices should be in a long-term decline for 11-17 months, descending to the 4-year cycle trough, expected to occur sometime between mid-December 2026 and mid-July 2027. Price-wise, the bullish 4-year cycles have decreased between 14.85-25.83%, which produces a historical price target span of 0.8958-1.0285. If we apply the 38-62% retracement forecast, we get 1.1106-1.0506. The overlap produces 1.1106-1.0285, as the most probable price target range for the 4-year cycle low.

THE INTERMEDIATE-TERM CYCLE

The 4-year cycle has so far always been split into two 24-month intermediate-term cycles. We should therefore be in the 17th month of the second 24-month intermediate-term cycle that started on February 3, low at 1.0142. As the preferred view is that the 4-year cycle topped out in January 2026, it must have coincided with the second 24-month cycle crest. The prices are therefore anticipated to be on their way towards the second 24-month cycle low, which, with its 6-month orb, is projected to occur sometime in August 2026-August 2027. By overlapping with the time target for the 4-year cycle trough, we obtain mid-December 2026 to mid-July 2027 as the most probable time target for the forthcoming combined 24-month and 4-year cycle trough.

EURO Preferred Daily Chart, as of July 3, 2026.

LEADING TIME INDICATORS FOR THE 33-WEEK PRIMARY CYCLE AND ITS SUB-CYCLES

The preferred view is that July 6 starts the 17th week of the 33-week primary cycle, off the March 13, 2026, low at 1.1410 USD. The previous report stated: "As you can see in the daily chart, the Euro has been in a consolidation mode for close to a year and therefore has not revealed its overall long-term trend." It looks like the Euro has finally shown its hand by falling below the start of the current primary cycle, which confirms that the

ongoing primary cycle is in a bearish trend.

Therefore, my expectation is that the lowest price of this primary cycle should occur at its very end. This forthcoming primary cycle low is projected, with its 8-week orb, to happen sometime between September 2 and December 25 and could very well coincide with the anticipated 4-year cycle trough. If this turns out to be true, then the primary cycle low appears more likely to bottom out in December. Nevertheless, keep in mind that we could get one more 33-week primary cycle to complete the 4-year cycle.

The bearish trend confirmation underlines that the April 17 high at 1.1848 was the primary cycle crest. Meanwhile, previous reports already detailed: *“The prices should decline to either the first 12-week major cycle low or a 15-week half-primary cycle bottom, expected in the time frame May 9-July 6 and May 26-August 2, respectively.”* So far, we got a good candidate for the first sub-cycle low in week fifteen on June 24, at 1.1324. It occurred within the three-trading-day boundary of the one-star June 26-29 CRD, which further strengthens the sub-cycle low possibility. However, since this bottom was made within the time target for both types of sub-cycles, we cannot yet tell whether this primary cycle is splitting into three 12-week major cycles or two 15-week half-primary cycles.

The previous month highlighted: *“Once the first sub-cycle low is cemented, the prices should rally in this bearish scenario for 3w+/-2w or 5w+/-3w, to either the second major cycle crest or the half-primary cycle top, respectively.”* If the June 24 low holds, then the time targets for the sub-cycle crests become July 3-August 3 and July 8-August 18, respectively.

Furthermore, from last month: *“As we are approaching the middle of the primary cycle, we need to be on the alert that the primary cycle could split with a combination pattern, which involves three major cycles and two half-primary cycles. There is only a 13% probability for this configuration to occur, but if this unfoldment is active, then the prices should now be forming the 12-week major cycle low, sometime between May 9 and July 6. This low is followed by a 3w+/-2w rally to the second major cycle crest, from where the prices should decline into the 15-week half-primary cycle low, due in the time frame between May 26 and August 2. Finally, from this bottom, the prices should make a 5w+/-3w bearish rally to the 15-week half-primary cycle crest.”*

Hence, if the June 24 low was a first major cycle low, then the second major cycle crest is due to unfold sometime between July 3 and August 3. The prices should then decline into the half-primary cycle low, due, at the latest, by August 2, from where the prices should make a 5w+/-3w rally to the half-primary cycle crest.

TREND ANALYSIS

The basic (minimum) trend indicator is bearish for the new preferred 33-week primary cycle that started on March 13, as the prices have fallen below its start of 1.1410.

The daily moving average trend indicator for the 33-week primary cycle is in a bearish trend, as the faster 28-day moving average (1.1503) is below the slower 83-day MA (1.1597), while the price (1.1435) is below both MAs (daily chart).

The weekly moving average trend indicator for the 24-month cycle is in a bearish trend, as the faster 17-week MA (1.1586) is below the slower 52-week MA (1.1650), while the price (1.1435) is underneath both MAs (weekly chart).

PRICE OBJECTIVES FOR THE 33-WEEK PRIMARY CYCLE

As we have the confirmation that the April 17 primary cycle crest was established at 1.1848, we can now give an overall price target estimation for the future primary cycle low. Historically, a bearish primary cycle has declined between 6.81-18.56%, which in this case would generate a price objective span of 0.9649-1.1041. However, as my first thinking is that a 4-year cycle trough is also expected to cement in the narrowed-down price target of 1.1106-1.0285, we need to keep this latter span as the price objective for the primary cycle low.

The previous report stated: *"When the primary cycle top is in, the prices should head south towards either the first 12-week major cycle low or a 15-week half-primary cycle bottom, projected to happen at a decline of 4-9.33% and 4.92-13.26%, respectively."* If we use the 1.1848 primary cycle crest of April 17, we obtain 1.0743-1.1374 and 1.0276-1.1265, respectively. So far, the prices have come down to 1.1324 on June 24, so from a price point-of-view, this low could have been the first major cycle bottom. Nevertheless, I am not ready at this time to take the half-primary cycle scenario off the table.

The previous report analyzed the first sub-cycle low: *"Although the prices can obviously reverse anytime now, the next CRDs are on June 26-29 and July 6. The prices could reverse at those time bands and then rally into the three-star CRD of July 17-20. This would be a bearish short-term rally. We would either get a rally up to the second major cycle crest, anticipated after a rise of 2.68-4.97%, or up to a half-primary cycle top, projected at an increase of 2.57-7.10%."*

Therefore, if the 1.1324 low of June 24 holds, the price target for the major cycle top is estimated at 1.1628-1.1887. The 38-62% retracement calculation produces 1.1524-1.1648. The overlap generates 1.1628-1.1648 as the most probable price target for the second 12-week major cycle crest. There is a descending resistance line that joins the January and the April primary cycle crests, which is right now at 1.1630 and falling. This could be where the reversal occurs.

Similarly, the half-primary cycle crest is historically projected to reach 1.1616-1.2128, while the 45-85% retracement gives 1.1560-1.1769. The overlap produces 1.1616-1.1769, as the most likely price objective for the 15-week half-primary cycle crest.

Previous reports detailed: *"If the combination pattern is active, then the prices should, as already discussed, be forming the 12-week major cycle low. This low should be followed by a 2.68-4.97% rally to the second major cycle crest, from where the prices should decline into the 15-week half-primary cycle low, due to unfold in the price target span of 1.0276-1.1265. Lastly, from this bottom, the prices should make a 2.57-7.10% bearish rally to the 15-week half-primary cycle crest."*

Therefore, if the 1.1324 low of June 24 holds as the first major cycle low, then the prices should rally to 1.1628-1.1648 to establish the second major cycle top. From here, the prices should decline into the price target of 1.0276-1.1265 for the half-primary cycle low, which should then be followed by a 2.57-7.10% rally to the half-primary cycle crest.

BIAS

In the previous report: *"The Euro has been challenging to forecast for a few months. The Euro is not showing much strength, and we are slowly running out of the preferred time band for a potentially higher 4-year cycle crest. There are now also several points not supporting the bullish outlook, such as the moving average trend indicators, where both have gone bearish. My bias is therefore leaning towards the bearish outlook, as clues look to be*

supporting the idea that the 4-year cycle crest was potentially established in January of this year.”

Further: *“Thus, I am recommending that aggressive traders look for opportunities to go long at the forthcoming first sub-cycle low and then to exit their long position at the targets for the next bearish sub-cycle crest. If the prices break below the 1.1410 low of March 13, we will have confirmation that the bearish scenario is active.”* We have the bearish confirmation, and the bearish recommendation remains.

If, on the other hand, prices were to go against my bias and surpass the 1.1848 presumed primary cycle crest of April 17, then we need to switch to bullish strategies. The confirmation that the 4-year cycle is still ahead occurs if the prices surpass the 1.2078 crest of January 2026.

STRATEGIES

Position Traders: We are flat right now. The plan is to go long at the forthcoming primary cycle low.

Aggressive Traders: Previous recommendation still holds: *“Look for opportunities to go long, at either the first 12-week major cycle low, expected sometime between May 9 and July 6, at 1.0858-1.1557, or the 15-week half-primary cycle bottom, projected to happen in the time frame May 26-August 2, at 1.0597-1.1469. Set your stop-loss below the newly formed low.”*

The June 24 low, at 1.1324, could have been the first sub-cycle low. Therefore, the recommendation is to look for opportunities to go long and set your stop-loss just below the June 24 low. If you do get stopped out, then keep looking, as we are very much in the time band for the low.

Your target is either a bearish second 12-week major cycle crest or a bearish 15-week half-primary cycle top, anticipated to occur sometime between July 3-August 3 at the narrowed-down price target span of 1.1628-1.1648 and July 8-August 18 at the concentrated price objective of 1.1616-1.1769, respectively. The July 17-20 CRD could be when the reversal period +/- three trading days happens. However, keep in mind that Mercury is retrograde at this time, and we could get fakeouts and large price swings. The following CRDs are a two-star on July 24-27 (Mercury goes direct), a one-star on August 7-10, and a two-star on August 14-17.

Once the sub-cycle crest is in place, exit your long position and look for opportunities to go short, with your stop-loss placed above the newly formed crest. Targets will be given in the next report.

HAS CRUDE OIL FOUND SUPPORT? by Pouyan Zolfagharnia, MMA Analyst

Cycle	Progress
6-year	7 th month
3-year (36 months)	7 th month
4-year (44 months)	38 th month (if active)
15-month	7 th month
Primary (19 weeks)	12 th week

LONG AND INTERMEDIATE-TERM CYCLES

**WTI CRUDE OIL WEEKLY
FUTURES NEARBY CONTRACT**

95-Week dotted line
48-week solid line

1 is the start of the 12-year cycle.
1 and 3 are the 6-year cycles.
1, 2, and 3 are the 36-month cycles
I and II are the phases to the 36-month cycle.
A & B are the 6-year crest.

The main chart displays WTI Crude Oil Weekly Futures Nearby Contract prices from Q2 2020 to Q3 2026. It features a 95-week dotted line and a 48-week solid line. Key annotations include 'A' at the peak in early 2022, 'B?' at a peak in late 2025, and various cycle markers like '1i', '2', '2i', and '3'. A secondary chart at the bottom shows CCI-Standard (-100) with red trend lines.

28

From 2020, the 6-year cycle was due in 2026 +/- 1 year. That, in turn, breaks down into two 3-year half-cycles, where the first one formed with the low of May 2023 that lasted 37 months. The second 3-year cycle then bottomed in December 2025, lasting 31 months. This was also a 6-year trough, and places us in the 7th month of the new 3- and 6-year cycle. The bullish momentum and the fact that we have now taken out the potential 44-month crest of September 2023 at 95.03 give further legitimacy to this outlook, and moving forward, it becomes the preferred long-term cycle labeling. The price target for this new 6-year cycle is 185.50 +/- 21.89.

We are now at the mid-point of the 15-month cycle and may be seeing a cyclical low form here. However, I am expecting prices to remain above the descending trendline, which acted as resistance whilst Saturn was transiting Pisces (the sign of Crude Oil). Having filled the gap up that took place with the exit of Saturn from Pisces, we may be finding support, which suggests another rally in Crude Oil may be forming.

Basic Long-Term Trend Indicators are downgraded to bearish, as we are forming lower-highs and lower-lows. This will be upgraded to neutral if we start forming higher-lows.

The Moving Averages Trend Indicators are downgraded to neutral, as prices drop below the moving averages (MA), while the fast 48-week MA just closed above the slow 95-week MA. The trend will be upgraded to bullish, turning neutral, if prices close above the fast 48-week MA. It will turn bullish if we close above the 48-day MA.

THE PRIMARY CYCLE

Primary cycles in Crude Oil last 15-23 weeks, and the phases of the primary cycle include half-primary cycles lasting 8-12 weeks and major cycles lasting 5-8 weeks.

We are commencing week 12 of a new cycle that began on April 17 at 78.97. This cycle has turned bearish by taking out that low and further supports the idea that Crude Oil could fall to a 15-month cycle low. The first major

cycle trough formed on May 29 at 86.35 in the orb of the May 22-26 CRD and was accompanied by bullish oscillator divergence in the CCI. Prices are now either dropping into the half-primary cycle or the second major cycle low. We remain in the orb of the half-primary trough this week. We also remain in the orb of the second major cycle over the next 3 weeks. We have filled the gap from February (67.83-69.20) and may see a rally at least to the 16-day MA.

The price target for the corrective rally is 82.02 +/- 3.54. Prices may rally back up and fill the gap between 82.42-83.20, which is also within the range of the corrective rally, before the next move down. However, there is also a chance that prices will get rejected at the 16-day MA and form the primary trough before we get the corrective rally.

GEOSMICS

As noted last month, *"There are no strong geocosmic aspects in early June. We have the Venus-Jupiter conjunction on June 9, which could be seen as a benevolent and peaceful aspect. If we are to get a breakthrough in the peace deal, this would be the week for it to happen."* Progress on the peace deal was announced shortly after the Venus-Jupiter conjunction.

As we head into July, several tense aspects are forming, starting with the July 4 Mars-Uranus conjunction. We also have Neptune as the co-ruler of Crude Oil stationing retrograde on July 7 and Jupiter opposing Pluto on July 20. These aspects would support the notion that a reversal (a major or half-primary cycle low) is expected this week, if it didn't already form on July 2. However, we may not see a significant move higher until the primary cycle forms in August.

TRADING STRATEGIES

Position traders: They were stopped out of the long trade. Look to go long on a decline to 64.50 +/- 0.50 with a stop-loss below 60.00.

Aggressive traders: They were stopped out of the long trade. Go short on a rally to 75.82 +/- 0.50 with a stop-loss above 79.00. Cover 2/3 on a decline to 67.12 +/- 0.50 and the remainder at 65.00 +/- 0.50. Pivot long on a decline to 62.00 +/- 0.50 with a stop-loss below 60.00.

SOYBEANS

SOYBEANS APPEAR TO BE EARLY IN A NEW PRIMARY CYCLE by Wyatt Fellows, MMA Analyst

[\[Back to Topic Menu\]](#)

Cycle	Progress
5.5-year (69 months)	23 rd month
34-month	23 rd month
17-month (2 nd)	6 th month
11-month (2 nd)	11 th month
18-week primary	3 rd week

Soybeans took the June 30 USDA Planted Acreage report that showed increased Soybean plantings in stride. Front-month contracts fell to a new low, but the deferred November contract made a double-bottom. With weather issues starting to become a concern (extreme heat) in places like Europe and with forecasts in the U.S. calling for a more persistent high-pressure ridge settling in over the Midwest, grain prices are starting to build in a weather premium. The key will be if the May highs can now be exceeded.

LONG AND INTERMEDIATE CYCLES

July will be the 23rd month of the 34-month cycle measured from the August 2024 low. This low was also likely a 5.5-year cycle bottom, but until Soybeans can exceed the May 2024 high of 1258.25, this can't be fully confirmed. The expiring July contract got close to this level when it reached 1250.75 on March 12. However, following another attempt at this level in May, forming what looks like a double-top chart pattern, Soybeans are in retreat mode. However, they appear to be probing for a bottom to make another run at this critical price level.

The 34-month cycle can break down as a three-phase pattern of 11-month cycles, or the more common two-phased pattern of 17-month cycles. They can also deploy as a combination of each of these patterns, which looks to now be occurring in this current 34-month cycle. The first 11-month low occurred in August 2025 in the 12th month (11-month cycles have a range of 9-13 months), so it was right on time (marked C on weekly chart). July

will be the 11th month of the second 11-month cycle and is due to bottom at any time over the next 3 months. It is possible an 11-month low just formed on June 30 following the release of the USDA planted acreage report. Last month stated, *“The price target for an 11-month bottom could be 1093.00 +/- 32.00.”* The expiring July contract made a low of 1098.75, so the price reached the center of the price zone given. This is strong support that a low has indeed been made, but with the 11-month time band stretching through September, lower prices can’t be ruled out. A rally back above the 24-week moving average is needed to start to confirm a low is in. Soybeans are doing that now at the time of this writing, so this market is starting to look good technically.

The January low (labeled D on the weekly chart) looks like it could have been a 17-month half-cycle bottom as well. It occurred exactly 17 months from the August 2024 low, so right on time. Supporting this idea is that Soybeans fell for two months following the November 2025 high, testing the 36-week moving average. It should be noted that Soybeans have been respecting this moving average on a weekly closing basis during the month of June. July would be starting just the 6th month of the second 17-month cycle with plenty of time to rally to new multi-year highs.

THE PRIMARY CYCLE

There are still two possible primary cycle labelings for Soybeans, but now that we have rolled to November as the front-month contract, one is starting to show itself as being the correct interpretation. Therefore, the week of July 6 will begin the 3rd week of a new primary cycle, measured off the June 15 low of 1121.75 in the November contract. Primary cycles in Soybeans last 15-21 weeks, and the previous primary cycle bottomed in the 24th week, so this one expanded by a few weeks. However, Soybeans were/are in a time band for an 11-month low, so a distorted primary cycle wouldn’t have been out of line. When longer-term cycles are due, shorter cycles can expand or contract. Furthermore, there was intramarket bullish divergence between the Aug and Nov contracts: the Aug contract made a slightly lower low on June 30, but the Nov contract did not (it made a double bottom to its June 15 low instead).

It is essential for Soybeans to trade back above the 45-day moving average to confirm this outlook, and Soybeans are doing just that by exploding to a high of 1190.75 at the time of this writing. This is now above the

bearish primary cycle crest target of 1168.00 +/- 11.00. Therefore, the next price target is the previous primary cycle crest of 1214.00. Above there, the MCP price target for the next primary cycle crest becomes 1280.25 +/- 19.00. This is our preferred path moving forward unless November Soybeans fall below 1121.75.

Alternatively, it is possible that July 6 begins the 13th week of the primary cycle, as measured from the April 8 low of 1135.00 in the November contract. It is next due to bottom in 3-9 weeks. The primary cycle in this labeling is technically bearish even though the June 15 low was above the March 17 low in the now prompt November contract. This implies lower prices below 1121.75 before the next bottom is in.

Major cycles in Soybeans tend to last 5-8 weeks, whilst half-primary cycles last 8-11 weeks. The best fit for the phase breakdown of this primary cycle in this alternate outlook is that July 6 will begin the 3rd week of the second half-primary cycle measured off the June 15 low. We would be expecting a 3-13 day corrective rally back to the 45-day moving average before Soybeans turn back lower. Soybeans exploded through this moving average, so this alternative labeling is looking less likely unless Soybeans reverse lower soon. This possibility still can't be ruled out, being that we are in the middle of the July 6 CRD.

GEOCOSMICS

Front-month Soybeans made a low on June 30, which was in orb of the June 26-29 CRD. Further, it was within 3 trading days (grain markets were closed on Friday, July 3) of the Mars/Uranus conjunction that took place on July 4. This is a powerful reversal signature for Soybeans with a 75% chance of a primary cycle occurring within 10 days. With today's price action, this looks like it indeed coincided with a primary cycle low.

Next up is the July 17-20 CRD, but it carries a large orb of 10 days, being that long-term aspects are involved. A more refined CRD occurring July 24-27 +/- 3 trading days could be the next pivotal time for Soybeans. Mercury will be turning back direct on July 23 while Saturn stations retrograde on July 26. The Sun will oppose Pluto on July 27, and Venus will square Mars on July 29. These are all level 2 reversal signatures for Soybeans, and this will be the time band for a major cycle crest and/or trough.

TRADING STRATEGIES:

Position traders: They were long and advised, *"Exit 1/3 at 1170.00 +/-10.00 if offered."* This price target was hit today, July 6, in the August contract, so we will assume traders are out of 1/3 with good initial profits. Roll remaining longs to the November contract and exit another 1/3 at 1210.00 +/- 7.00. Set the stop-loss on a close below 1121.00 for now.

Aggressive traders: They were long and advised last month, *"Less risk-tolerant traders may wish to exit all at 1165.00 +/- 10.00 in case Soybeans are indeed in a younger and now bearish primary cycle with the intent to go long again in the next few months. Alternatively, more risk-tolerant traders can exit 1/3 at 1170.00 +/- 10.00. Keep the stop-loss on a weekly close below 1100.00."* We will assume aggressive traders are now out of 1/3 for decent profits. Roll remaining longs to the November contract and exit another 1/3 at 1210.00 +/- 7.00. Set the stop-loss on a close below 1121.00 for now. Traders may also buy any covered longs back at 1160.00 +/- 7.00 if offered. Set the stop-loss on all longs below 1121.00.

The next MMA Cycles Report will be released August 10-11, 2026.

Geocosmic Signatures for near-term: July 4 $\odot\sigma\text{H}$ (9.39*), July 5 $\sigma\Delta\text{F}$ (9.38*), July 6 $\odot\Box\text{h}$ (8.90), July 7 Ψ_{SR} (9.52**), July 13 $\text{F}\Box\text{H}$ (8.98), July 17 $\text{H}\Delta\text{F}$ (8.83), July 20 $\text{L}\Delta\Psi$ (9.46**), July 20 $\text{L}\sigma\text{F}$ (8.45), July 23 F_{SD} (8.88), July 26 h_{SR} (9.46**), July 27 $\odot\sigma\text{F}$ (9.29*), July 27 $\odot\Delta\Psi$ (9.28*), July 29 $\odot\sigma\text{L}$ (9.04*), July 29 $\text{F}\Box\sigma$ (9.00*), Aug 6 $\odot\Delta\text{h}$ (8.88), Aug 10 $\text{F}\Delta\text{F}$ (9.06*), Aug 10 $\text{F}\sigma\Psi$ (8.94), Aug 11 $\text{F}\Delta\text{H}$ (9.25*), Aug 17 $\sigma\Box\Psi$ (8.61), Aug 21 $\text{F}\sigma\text{h}$ (9.43**), Aug 28 $\odot\Box\text{H}$ (9.70**), Aug 31 $\text{L}\Delta\text{h}$ (9.39*)

Strongest signatures have ** and are considered Level 1 types. With a single asterisk (*), it is considered a Level 2 type, moderately strong. No asterisks mean it is a Level 3 type, the weakest signatures corresponding to market cycles and their reversals. The idea is to find a time band in which there are no more than six calendar days between two consecutive signatures and then take the midpoint of that time band as a critical reversal date (CRD). Sometimes there are long stretches that have multiple aspects occurring within six days of each other. That is the case during the month of July. In this circumstance, we break this large stretch of time into two smaller CRDs, with a level 1 signature being present in each. For July, the CRDs become July 6 (because of the July 4th market holiday in the U.S.), which includes three level 1 signatures, and then July 17-20. This latter one is of particular importance due to long-term aspects transpiring and could be given a larger orb. For August, we have August 14-17 and then a big one on August 31.

ANNOUNCEMENTS & EVENTS

ANNOUNCEMENTS

NOTE 1: THE JULY ISSUE OF THE [MMA MONTHLY CYCLES REPORT](#) WILL BE RELEASED THIS WEEK, JULY 7–8. This issue will be especially timely because it will cover the powerful Jupiter convergence taking place July 15–25, when Jupiter will sextile Uranus, trine Neptune, and form an opposition to Pluto, all during the first of five passages of the Uranus–Pluto trine that will continue into 2028. Will the U.S. stock market melt up to a new all-time high before beginning a powerful decline? Or will it continue breaking to new highs? Each issue includes our outlook for the U.S. stock market (DJIA and S&P), Gold, Silver, Copper, Treasuries, the Euro currency, Crude Oil, and Soybeans. The MMA Monthly Cycles Report also provides MMA's original geocosmic CRDs and solar/lunar reversal dates over the next several weeks, as well as trading strategies for both position traders and aggressive short-term traders. If you would like to try a one-month subscription, you can sign up for the [July issue](#) for only \$35 — or save by ordering a three-report or twelve-report subscription.

Additionally, the monthly [MMA European Cycles Report](#), covering the DAX and SMI, and the [MMA Japan Cycles Report](#), covering the Nikkei stock index and the Dollar/Yen outlook, will be issued Tuesday–Wednesday, when these markets will also be at critical junctures.

NOTE 2: A SIX-WEEK SUMMER SCHOOL COURSE ON ESOTERIC ECONOMICS: THE HIDDEN ARCHITECTURE OF WEALTH, BY GIANNI DI POCE, WILL BEGIN ON SUNDAY, JULY 12. This immersive, six-week online course is the complete companion to *Esoteric Economics*, the financial astrology textbook by [Gianni Di Poce](#). The course touches on conventional economics, but it also reveals the deeper, often invisible currents that truly govern

wealth: archetypal forces, temporal rhythms, capital flows, and the ancient principles that have shaped civilizations for millennia. The course blends rigorous historical and technical analysis with esoteric insight, practical tools, and visionary thinking. You will not simply study economics — you will be initiated into its hidden language and learn to navigate it with clarity, confidence, and creative power. The cost of this six-week course is \$300, and registration is now open! Click [here](#) to register.

NOTE 3: [THE ANNUAL MMA MID-YEAR MARKET WEBINAR](#) WITH MMA MARKET ANALYSTS WAS GREAT — AND RECORDINGS ARE NOW AVAILABLE. This year's webinar was conducted in an interview format hosted by Raymond Merriman. The feedback from attendees was very positive, with many saying they loved the new interactive format in which Ray presented his views and then invited each analyst to share their outlook for the second half of 2026. The analysts and markets covered this year included NASDAQ (Wiebke Held), DJIA (Gianni Di Poce), Euro (Ulric Aspegren), Bitcoin (Ray Merriman), Silver and Crude Oil (Pouyan Zolfagharnia), and Gold and T-Notes (Wyatt Fellows). The webinar lasted just over three hours, with two five-minute breaks, yet no one seemed to get exhausted thanks to the lively exchanges. The recording costs \$66 (a super bargain for a workshop covering these markets), which includes the presentation slides. The markets discussed are still very relevant, and many of the setups described are indeed unfolding now! To order, [click here](#).

Here are three of the many positive responses to the new format and the content:

Today's webinar was fantastic. I loved the format. There's a lot of talent in MMA. I listen, learn, and make a lot of money using MMA's products. Your technical analysis schoolhouse mirrors what the CIA created 25 years ago for their analysts (Sherman Kent School for Intelligence Analysis). Students graduating from your program today will carry your legacy forward for the next 50 years.

— R.B., veteran trader

That is great feedback! I really enjoyed it too and learned a lot from the team.

— Pouyan Zolfagharnia, MMA Crude Oil and Silver analyst

I also noticed a great improvement, as we showed a unified team (including the same slide background) and more of a discussion rather than a presentation. I think it helped viewers acquire greater clarity through a more active process during the webinar, where you tightened up possible outcomes across many markets.

— Ulric Aspegren, MMA Euro analyst from the webinar

NOTE 4: COMING SOON: RAY MERRIMAN'S NEW BOOK, [JUPITER AND SATURN TRANSITS: MASTERING THE CYCLES OF LIFE](#). This is Book One, the first of five books that will be written on the outer planets transiting the natal chart over the next four years. Nothing like this has ever been done in the history of astrology. This first book, on the transits of Jupiter and Saturn, is approximately 425 pages long, covering all the major transits of Jupiter to one's natal planets and angles, including interpretations of the opening and closing sextile, square, and trine aspects. The Saturn section also includes the opening and closing semi-square and sesquiquadrate transits to all natal planets and angles, plus the "Business Cycle" of transiting Saturn. Each transiting aspect is ranked on a scale of -3 to +3 in terms of trading and investment potential, which alone is worth the price of the book.

Here are early reviews by two of the world's leading astrologers after receiving an early draft of this book:

Ray's Jupiter and Saturn Transits: Mastering the Cycles of Life is a fabulous, comprehensive guidebook rich with humanistic wisdom for astrologers. This book is amazing... exceptional in every way! Articulating the Saturn and Jupiter transits to natal planets and angles, Ray offers special emphasis on delineating the waxing and waning aspects. His house-by-house interpretation of these powerful astrological energies and influ-

ences brilliantly combines useful tips and insightful keywords. Ray also shares his valuable expertise in financial astrology by including the Financial Ranking for trading with the transits, which makes this book very special!

— Kathy Rose, renowned full-time consulting astrologer and curator of Rose Astrology, with over 40 years of professional practice

Jupiter and Saturn Transits: Mastering the Cycles of Life is a valuable reference guide from financial astrologer and analyst Raymond A. Merriman. This book covers the transits of Jupiter and Saturn to one's natal chart and applies them to financial trading or investing. Ray has once again dispensed his wisdom and decades of research experience in 400+ pages of a keepsake for this and future generations of astrologers.

The book begins with a personal story, perfectly setting the stage for Ray's analysis of how these two powerful influencers can affect one's life, and what opportunities or potential pitfalls in trading might also appear. Written in a clear reference style, it allows readers to go directly to the areas that are affecting them now. As the planets advance, check the latest updates, and then use the book the rest of the time as an astrology textbook on synthesizing transiting planets, the most-requested area of astrology for consultations and readings.

For traders or investors, the inclusion of Ray's practical +3 to -3 "Ranking of Financial and Trading Potential" is worth the book alone, providing a quick scale to evaluate periods of potential opportunity or caution during a Jupiter or Saturn transit. No question, Ray has penned another classic. This book should be in any astrologer's collection, whether they are involved in the financial markets or not.

— Thomas Miller, prominent astrologer and host of the popular daily audio program, the *Fun Astrology* with Thomas Miller podcast

The book **JUPITER AND SATURN TRANSITS: MASTERING THE CYCLES OF LIFE** is due for release in mid-August. The list price is \$39.99. However, those who order now, prior to the actual printing of the book in mid-August, will receive the special pre-publication price of \$33.00 (plus postage for the printed edition; the eBook requires no postage). To order at the pre-publication price, click [here](#).

NOTE 5: THE [JUPITER REPORT: YOUR MOMENTS OF OPPORTUNITY!](#) The *Jupiter Report* is written by Raymond Merriman. It is a 30- to 40-page report that all traders (and even non-traders) will find highly valuable. It identifies the times during the year when Jupiter transits are highlighted in your natal chart and explains the meaning of Jupiter's transits to your natal planets and angles over a 14-month period (including one month before your order date and one month after the year ends). *As an added bonus, each transit is ranked on a scale from -3 to +3 in terms of favorability for trading. Traders may find this especially valuable!* Would you like to know if you are under a +3 transit and therefore most likely to experience trading success? Or a -3 transit, with a stronger-than-usual potential for misjudgments that can be costly? The price for a personal 14-month *Jupiter Report* based on your birth data is \$69.

Coming soon! *The Saturn Report: Mastering Your Life Cycles*. Due out in late summer or early fall.

NOTE 6: THE [MMA SOLAR-LUNAR APP](#) OFFERS REVERSAL SIGNALS FOR THE DJIA, NASDAQ, GOLD, AND SILVER. It is an ideal tool to have in your back pocket if you are a short-term swing trader looking for high-probability dates that identify isolated lows and highs in these markets. Please note that this should not be used as a standalone system. It works best as an adjunct tool when cycle lows or highs are due, when a market is in a technically overbought or oversold condition, or when it is exhibiting intermarket bullish or bearish divergence relative to a related market. The app is currently available only on Apple devices (iPhone and iPad). *HOWEVER, IT WILL SOON*

BE AVAILABLE BY SUBSCRIPTION ON THE NEW MMA WEBSITE TO EVERYONE, INCLUDING USERS OF ANDROID PHONES, AROUND JULY 4! To learn more about the MMA app, [click here](#). To order on your iPhone, go to the Apple App Store and search for *Merriman Solar/Lunar Reversals*.

EVENTS

JULY 12, 2026: *Esoteric Economics* course begins with Gianni Di Poce. The six-week course costs \$300 and runs from July 12 to August 16. See above for further details. Click [here](#) to register.

SEPTEMBER 3, 2026: A UAC PRE-CONFERENCE WORKSHOP ON FINANCIAL ASTROLOGY BY RAYMOND MERRIMAN, 1:00–5:00 PM. This workshop will take place at the United Astrology Congress (UAC), the largest astrological conference in the world, which is held every four to eight years. More than 150 world-class astrologers will be presenting, and over 1500 attendees will be present. The conference will be held at the Marriott Downtown Chicago Magnificent Mile Hotel. In addition to the workshop, Ray will present another lecture during the six-day event on mundane astrology, titled "What Is Happening in the World from an Astrological Viewpoint," on September 5. **For more information, visit www.uacastrology.com.**

Disclaimer and using this information properly: Futures and options trading involve the risk of large losses as well as large gains.

Information is provided herein with sincere intent and according to MMA's original research studies and methodologies. These reports are provided mainly for "speculators." By its very nature, "speculation" means "willing to take the risk of loss." "Speculators" must be willing to accept the fact that they are going to have losing trades, many more than, say, "investors." That is why they are "speculators." The way "speculators" become profitable is not so much by a high percentage of winning trades but by controlling the amount of loss on any given trade, so the average trade on winners is considerably more than the average trade on losing trades.

MMA's comments, strategies, and data are given to serve as guidelines for traders for each day and/or week. Comments and strategies are based upon intraday and intraweek highs, lows, and closes at the end of the day or week. Traders are advised to use these only as guidelines - and use intraday analysis to establish positions in the directions of comments given, so long as those support/resistance (entrance) areas look favorable according to intraday analysis as well. Support and resistance are areas for day traders to look to buy and sell intraday. No guarantees are made for accuracy.

Support may represent favorable risk/reward places to buy if the trend is up. If prices trade below support, then have a close back above; it is considered a bullish "trigger" and oftentimes represents a good buy signal. Resistance may represent favorable risk/reward places to go short if the trend is down. If prices trade above, then have a weekly close back below; it is considered a bearish "trigger" and oftentimes is a good sell signal.
